SupeRR Selector Season 2

RAJASTHAN ROYALS

Identify the Most Reliable Players Under Pressure

ROUND 1 PROBLEM STATEMENT

Some players thrive when the game is on the line. Others struggle to deliver. But can we use data to distinguish those who consistently rise to the occasion from those whose performances dip under pressure?

Round 1 Challenge / Problem Statement

Build a data-driven system that measures how batters and bowlers perform in high-pressure match situations compared with their usual performance levels. Use your system to identify and rank the players who deliver most consistently when it matters.

What counts as pressure?

That is for you to define. Pressure might depend on the required run rate, wickets in hand, balls remaining, the stage of an innings, how close the contest is, or a combination of factors. You may consider other relevant match-context signals as well.

Choose your own approach, explain why your definition is meaningful, and show how it distinguishes pressure situations from ordinary ones. Your method should work for both batting and bowling performance.

The dataset

You will be provided with historical IPL and T20 International (T20I) data from 2022 onwards, including:

- **Ball-by-ball data:** delivery-level match records in CSV format.
- **Supporting data:** competitions, teams, players, matches, playing XIs, and competition-team-player mappings.

Use these files to connect player performance with match situations across competitions and seasons.

What you need to submit

Your final submission has two required components:

01 PLAYER RANKINGS	Two ordered top-10 lists: the 10 best-performing batters under pressure and the 10 best-performing bowlers under pressure. Select players in rank order, from 1 to 10, using the dropdown fields on Unstop.
02 METHODOLOGY REPORT	Upload a document that explains how you defined pressure, constructed your ratings, analysed the data, and arrived at your final rankings.

1. Player rankings — selected on Unstop

Submit both ranked lists using the player-selection dropdowns provided on the Unstop submission page:

- **Top 10 batters:** choose one player for each position, Rank 1 through Rank 10.
- **Top 10 bowlers:** choose one player for each position, Rank 1 through Rank 10.

Rank 1 should be your highest-rated player in each category. Do not repeat a player within the same top-10 list, and ensure the dropdown selections match the rankings explained in your report.

2. Methodology report — document upload

Your report should clearly cover:

- **Pressure definition:** the match situations and indicators you used, and why.
- **Performance measurement:** the batting and bowling metrics, player baselines, and rating or scoring logic.
- **Fair comparisons:** your approach to sample sizes, player eligibility, different match contexts, and the use of IPL and T20I data.
- **Evidence for your top 10:** the results, comparisons, tables or charts that support your selections and ordering.
- **Reliability and limitations:** how you checked consistency across matches, and where your model may be less certain.

Your methodology should be transparent enough for someone else to understand and reproduce your approach. Rankings must be supported by analysis of the supplied data, not reputation alone.

Optional: Share your journey

We would also love to see the people and thinking behind your solution. If you would like to, share a few photographs, screenshots of your work, or a short video (around 30–60 seconds) telling us what you thought of the challenge, how you approached the problem, and one interesting insight or moment from your process.

This is completely optional and will not affect the evaluation of your submission. If we would like to feature your content on our channels, we will seek your permission prior to using or publishing it.
